Patents

A Breakthrough Method for Manufacturing LFP (LiFePO₄) Batteries:

- Uses clean water for blending instead of NMP a toxic substance used by large competitors.
- Active material capacity 10-15% superior to competitors
- Unique carbon coating tech enables high-rate characteristics & excellent performance at low temperature
- Only that makes cathode active material in-house.

Current Production:

Currently operating out of 60,000 sq ft. facilities, and producing 3 tons of active material & 10,000 cells per month.
